RECORDING GUIDE

ServiceSync
Five-minute demonstration

ANUSIKAN S. | EG/2023/5480
University of Ruhuna, Faculty of Engineering
Web Development Module | Individual project

Target recording: **4 minutes 45 seconds**. Keep the final 15 seconds as a buffer. Read only the SAY paragraphs aloud; SHOW paragraphs are screen instructions. Pause naturally while clicking.

Prepare before recording

- Start MongoDB, the server and the frontend. Check that pages and uploads load.

- Use two clearly labelled browser windows: customer and provider. Sign in beforehand; briefly show the login page in another tab without entering passwords on camera.

- Prepare a provider whose skills and location match the demo job. Use a simple example: House cleaning, cleaning, Galle, Rs. 3,000. Use a future appointment and a safe sample photo.

- Keep a separate OPEN job named Delete demo ready for deletion. Keep the main demo job for the quote-to-completion journey.

- Keep short description and quote message text ready to paste. Use a quote of Rs. 2,800. Do not pre-accept the demo quote.

- Open the ER diagram and a mobile-size view in advance. Hide private messages, passwords, tokens and unrelated tabs. Keep the camera on and microphone clear.

One continuous story

Customer posts a request / provider finds it and quotes / customer compares and accepts / both exchange messages / customer completes the booking / optional review / provider sees completed earnings.

Rehearse once with another test job. The completed rehearsal job cannot be reused for an OPEN-job demonstration. Record a fresh job for the final take. Do not spend recording time waiting for installations or server startup.

SCRIPT / PART 1

Introduction and job management

0:00-0:25 | Introduce the project

SHOW: Show the home page, then briefly the login page. Keep your camera visible.

SAY: Hello, I am Anusikan S., index number EG slash 2023 slash 5480, from the Faculty of Engineering, University of Ruhuna. This is ServiceSync, my individual Web Development project. It connects customers who need services with providers who can complete them. The application uses React, Node.js, Express and MongoDB.

0:25-1:10 | Create a job and show validation

SHOW: Switch to the customer. Open Post a New Job. Submit once with required fields empty, then fill the prepared details, add the photo and future appointment, and submit. Open My Posted Jobs.

SAY: Customers and providers have separate accounts and role-based access. Here I am using the customer account. First, submitting an empty form shows the required-field validation. I will now create a house-cleaning job with a description, category, location, budget, appointment and photo. After submission, the job appears in My Posted Jobs with OPEN status. This demonstrates creating and reading a saved record.

1:10-1:40 | Edit, persist and delete

SHOW: Edit the new job budget from Rs. 3,000 to Rs. 3,200, save and refresh. Delete only the separate Delete demo job through its confirmation dialog.

SAY: I can edit my own open job. I am changing its budget and saving it. After refreshing, the updated value remains, showing database persistence. I will also delete this separate test job and confirm the action. Together, these operations demonstrate the full create, read, update and delete flow for job management.

Checkpoint at 1:40

The main job must still be OPEN. Switch immediately to the provider window. If you run slowly, shorten your explanation; keep the visible save, refresh and delete confirmation.

SCRIPT / PART 2

Quotes, booking and completion

1:40-2:30 | Provider discovery and customer acceptance

SHOW: Provider: find the job using search and one relevant filter; briefly change sort. Enlarge the job photo and close it. Submit Rs. 2,800 quote. Customer: open View Quotes, view the provider profile, return and accept.

SAY: In the provider account, I can browse matching jobs, search by title, filter the results and change their order. I can also inspect the customer photo inside the website before quoting. I will submit a price of two thousand eight hundred rupees. Back in the customer account, I can compare the offer and view the provider profile before accepting. Acceptance assigns the job and creates the booking with the agreed price.

2:30-3:10 | Message and complete the service

SHOW: Open the accepted booking. Customer sends "Please arrive at the agreed time." Provider opens it and replies "Confirmed, thank you." Customer marks the booking completed.

SAY: The accepted booking lets the customer and provider exchange messages about the service. I will send a message and reply from the provider account. In a real booking, the service would take place before this next step. For this demonstration, I am marking the work completed as the customer. The booking now moves to History, and the agreed amount contributes to the provider earnings summary.

3:10-3:35 | Optional review

SHOW: In customer History, click Review, choose a rating, enter a short comment and submit. Show the reviewed state.

SAY: Reviews are optional. The customer can choose Review or leave the completed booking without submitting feedback. I will submit a rating and a short comment. Each completed booking allows one review, and that feedback contributes to the provider average rating. The booking now shows that it has been reviewed.

Keep the flow credible

Do not suggest that the service really happened during the recording. Explain the time jump before marking it complete. Earnings are a summary of completed bookings; do not describe them as a processed online payment.

SCRIPT / PART 3

Supporting features and closing

3:35-4:05 | Schedule, notifications and mobile

SHOW: Provider: briefly show Schedule and Earnings. Open the notification bell. Switch to the prepared mobile view and open the left hamburger menu.

SAY: Providers can track appointments in their schedule and view their completed-work earnings. The notification area highlights booking and quote updates, while messaging has its own alerts. On mobile, the navigation changes to a compact menu with message and notification icons. The job cards and booking pages adapt to the smaller screen.

4:05-4:30 | Database design

SHOW: Show the ER diagram at a readable zoom. Point to User, Job, Quote, Booking, Message, Review and Notification. Avoid reading every field.

SAY: This entity relationship diagram shows the seven main MongoDB collections: users, jobs, quotes, bookings, messages, reviews and notifications. User references identify the customer and provider. Jobs receive quotes, bookings connect the participants, and messages and reviews relate to bookings. Authentication and ownership checks protect actions such as editing jobs and updating bookings.

4:30-4:45 | Close

SHOW: Return to the dashboard. Keep your camera visible and stop before five minutes.

SAY: This demonstration covered job management, provider discovery, quotation, acceptance, messaging, completion, reviews and responsive design. The project is currently demonstrated locally. Future improvements could include online payments and production deployment. Thank you.

Final recording checklist

- Video is no longer than 5:00; target 4:45.
- Camera remains on; speech and screen text are clear.
- Create, read, edit, refresh and delete are visibly demonstrated.
- The same main job is used from quote through completion.
- Profile, photo preview, messaging and optional review are visible.
- Schedule, earnings, notifications, mobile menu and ER diagram appear briefly.
- No private credentials or unrelated personal information are visible.
- Watch the exported video before submitting; use your index number in its filename.

If something is slow

Stop and rehearse again if a key action fails. For a small delay, shorten the supporting-feature commentary. Keep the core job CRUD and booking journey. Do not claim a successful feature without showing the result.
